

The background image shows two workers in safety gear on a steel structure. One worker is positioned higher up, and another is lower down, both connected to a rescue system. A red rescue kit is visible on the structure. The scene is set against a backdrop of industrial steel beams and corrugated metal.

How our Gotcha™ Kit became the generic name in post-fall rescue kits.

In 2003 SpanSet Australia released the Original Gotcha™ rescue kit, which was the first pre-rigged rescue kit specifically designed for recovering a fallen worker from a fall arrest system, without undue risk to the rescuer.

This revolutionary product was described by some as a once-in-a-decade breakthrough, and has spawned several pole based remote attachment rescue kits since. Specifically designed for the infrequent user, simplicity is the cornerstone of this kit.

Now a generic term for rescue systems, the kit is considered to be the benchmark standard by both industry operatives and emergency service personnel alike.

Meeting standards is good.
Setting standards is better.
